

# Exhibit 2

**U.S. Patent No. 8,549,339 (“’339 Patent”)****Accused Products**

Qualcomm’s products comprising one or more SoC each comprising two or more sets of processors implementing or based on the DynamIQ Shared Unit architecture (*e.g.*, ARMv8.2, ARMv9 ARMv9.2, and successors) or big.LITTLE architecture, including without limitation the Snapdragon 8 Gen 2 and the Snapdragon 835 Mobile Platform.

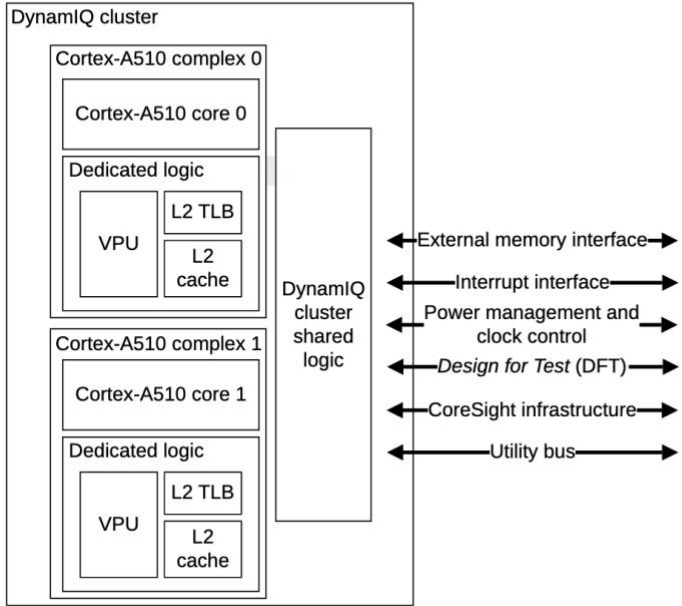

**Claim 1**

Claim 1	Accused Products
[1pre] 1. A multi-core processor, comprising:	<p>To the extent the preamble is limiting, each Accused Product comprises a multi-core processor.</p> <p>For example, Snapdragon 8 Gen 2 Octa-Core processor contains eight cores implementing the ARM DynamIQ Shared Unit-110 architecture. In a further example, the Snapdragon 835 Mobile Platform contains eight cores implementing the ARM big.LITTLE architecture.</p> <p><i>See, e.g.:</i></p>

Claim 1	Accused Products
	<p><b>Snapdragon 8 Gen 2 (2023)</b> <a href="#">[ edit ]</a></p> <p>The <b>Snapdragon 8 Gen 2</b> was announced on November 15, 2022.<sup>[252]</sup></p> <p>Notable features over its predecessor (8 Gen 1):</p> <ul style="list-style-type: none"> <li>• 4nm (TSMC N4) process</li> <li>• Support up to 16 GB LPDDR5X 4200 MHz</li> <li>• Support UFS 4.0</li> <li>• CPU features <ul style="list-style-type: none"> <li>• 1 <a href="#">Kryo Prime (ARM Cortex-X3)</a>, up to 3.36 GHz. Prime core <ul style="list-style-type: none"> <li>• 1MB L2 cache</li> <li>• Only 64-bit support <sup>[253]</sup></li> </ul> </li> <li>• 2 <a href="#">Kryo Gold (ARM Cortex-A715)</a>, up to 2.8 GHz. High Performance cores <ul style="list-style-type: none"> <li>• Only 64-bit support <sup>[253]</sup></li> </ul> </li> <li>• 2 <a href="#">Kryo Gold (ARM Cortex-A710)</a>, up to 2.8 GHz. Claim 1	Accused Products				
	Model number	Product Name	Fab	Die size	CPU
	MSM8998 <sup>[246]</sup>	Snapdragon 835	10 nm FinFET (Samsung 10LPE)	72.3 mm <sup>2</sup>	4 + 4 cores Kryo 280 (2.45 GHz Cortex-A73 + 1.9 GHz Cortex-A53)
	<a href="https://en.wikipedia.org/wiki/List_of_Qualcomm_Snapdragon_systems_on_chips#Snapdragon_800_series_(2013%E2%80%932021)">https://en.wikipedia.org/wiki/List_of_Qualcomm_Snapdragon_systems_on_chips#Snapdragon_800_series_(2013%E2%80%932021)</a>				

Claim 1	Accused Products
	<div data-bbox="667 272 1255 328"><h2>DynamiQ Shared Unit-110</h2><hr/></div> <div data-bbox="667 441 1600 555"><p>First DynamiQ Shared Unit of the Armv9 generation, up to 12 cores supported, up to 16MB L3, and enhanced power management features.</p></div> <div data-bbox="667 604 835 636"><p><b>Supporting:</b></p></div> <div data-bbox="667 669 892 928"><ul style="list-style-type: none"><li>• <a href="#">Cortex-X3</a></li><li>• <a href="#">Cortex-X2</a></li><li>• <a href="#">Cortex-A715</a></li><li>• <a href="#">Cortex-A710</a></li><li>• <a href="#">Cortex-A510</a></li></ul></div> <div data-bbox="634 954 1201 993"><p><a href="https://www.arm.com/technologies/dynamiq">https://www.arm.com/technologies/dynamiq</a></p></div>

Claim 1	Accused Products
	<p><b>Figure 2-2: Example configuration with two Cortex®-A510 single-core complexes</b></p>  <p>Arm Cortex-A510 Core Technical Reference Manual at p. 23</p> <p>Our initial testing shows that Snapdragon 835's Kryo 280 CPU is an octa-core, big.LITTLE configuration with four semi-custom A73 "performance" cores and four semi-custom A53 "efficiency" cores. Kryo 280's performance cores are pretty much equivalent to Kirin 960's A73 cores in both integer and floating-point IPC, but comparing them to Snapdragon 820's Kryo CPU shows mixed results: integer IPC improves but floating-point regresses.</p> <p><a href="https://www.anandtech.com/show/11201/qualcomm-snapdragon-835-performance-preview/6">https://www.anandtech.com/show/11201/qualcomm-snapdragon-835-performance-preview/6</a></p>

Claim 1	Accused Products
	<p><b>1.2 Document scope</b></p> <p>This application note focuses on the following processors and highlights important issues when powering up or powering down processor cores and clusters on an SoC.</p> <ul style="list-style-type: none"> <li>• Cortex®-A7.</li> <li>• Cortex®-A15.</li> <li>• Cortex®-A17.</li> <li>• Cortex®-A53.</li> <li>• Cortex®-A57.</li> <li>• Cortex®-A72.</li> <li>• Cortex®-A73.</li> </ul> <p>“High-level Considerations for Power Management of a big.LITTLE™ System Application Note 424,” available at <a href="https://developer.arm.com/documentation/dai0424/a/">https://developer.arm.com/documentation/dai0424/a/</a></p> <p><b>2.1 ARM® big.LITTLE™ system example</b></p> <p>A big.LITTLE system uses two different types of cores that are combined in a coherent system. big cores are designed for high performance while LITTLE cores are designed for high energy efficiency. The big cores are used for resource-intensive software threads, and energy-efficient LITTLE cores handle low-intensity software threads that use fewer compute resources. The result is high energy efficiency and high performance.</p> <p>“High-level Considerations for Power Management of a big.LITTLE™ System Application Note 424,” available at <a href="https://developer.arm.com/documentation/dai0424/a/">https://developer.arm.com/documentation/dai0424/a/</a></p>

Claim 1

Accused Products

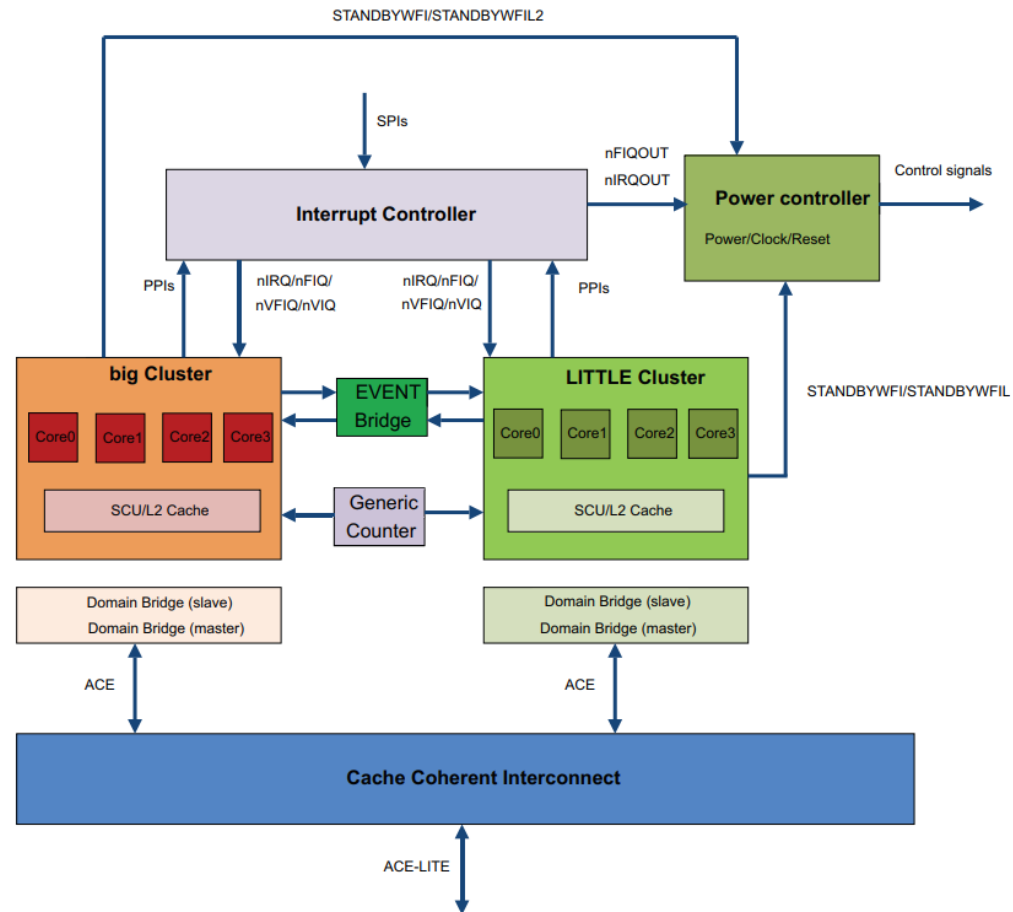

Figure 2-1 A typical big.LITTLE system

“High-level Considerations for Power Management of a big.LITTLE™ System Application Note 424,” available at <https://developer.arm.com/documentation/dai0424/a/>

Claim 1	Accused Products
<p>[1a] a first set of processor cores of the multi-core processor, wherein each processor core from the first set of processor cores is configured to dynamically receive a first supply voltage and a first output clock signal of a first phase lock loop (PLL) having a first clock signal as input;</p>	<p>Each Accused Product comprises a first set of processor cores of the multi-core processor, wherein each processor core from the first set of processor cores is configured to dynamically receive a first supply voltage and a first output clock signal of a first phase lock loop (PLL) having a first clock signal as input.</p> <p>For example, the Snapdragon 8 Gen 2 Octa-Core includes a first set of high efficiency processor cores (two or more ARM Cortex-A510 cores). The processor cores in the first set receive a dynamic supply voltage and a first output clock signal of a first PLL having a first clock signal as input.</p> <p>For another example, the Snapdragon 835 Mobile Platform includes a first set of high efficiency processor cores (two or more A53 cores). The processor core(s) in the first set receive a dynamic supply voltage and a first output clock signal of a first PLL having a first clock signal as input.</p> <p>ARM documentation for the big.LITTLE and DynamIQ architectures used in the Accused Products directly shows that each core cluster receives its own clock domain. At the time the Accused Products were designed, it was typical to produce this clock using a PLL that has a corresponding clock input. Furthermore, ARM documentation for an earlier, related device (the Cortex-A15_A7 MPCore test chip, which also has independent clock domains for different CPU clusters) shows each CPU cluster receiving an output clock signal from a PLL having a corresponding clock signal as input (<i>e.g.</i> from an oscillator). It is therefore substantially likely that each Accused Product specifically receives a first output clock signal of a first PLL having a first clock signal as input.</p> <p><i>See, e.g.:</i></p>

Claim 1	Accused Products
	<p><b>Snapdragon 8 Gen 2 (2023)</b> <a href="#">[ edit ]</a></p> <p>The <b>Snapdragon 8 Gen 2</b> was announced on November 15, 2022.<sup>[252]</sup></p> <p>Notable features over its predecessor (8 Gen 1):</p> <ul style="list-style-type: none"> <li>• 4nm (TSMC N4) process</li> <li>• Support up to 16 GB LPDDR5X 4200 MHz</li> <li>• Support UFS 4.0</li> <li>• CPU features <ul style="list-style-type: none"> <li>• 1 <a href="#">Kryo Prime (ARM Cortex-X3)</a>, up to 3.36 GHz. Claim 1	Accused Products
	<p><b>Cluster features</b></p> <p>The DSU-110 has the following cluster features:</p> <ul style="list-style-type: none"> <li>• Support for Arm®v9.0-A architecture cores</li> <li>• Support for up to four types of core, and a maximum of 12 cores in the cluster</li> <li>• <i>Power Policy Units</i> (PPUs) providing autonomous power management of the L3 cache and the cores</li> <li>• Support for cores running independently at different frequencies and voltages known as <i>Dynamic Voltage Frequency Scaling</i> (DVFS). For cores in a complex, DVFS is only possible for the whole complex not for individual cores.</li> </ul> <p>Arm DynamIQ™ Shared Unit-110 Technical Reference Manual, available at <a href="https://documentation-service.arm.com/static/62bb28beb334256d9ea8cc32">https://documentation-service.arm.com/static/62bb28beb334256d9ea8cc32</a>, at p. 19</p> <p>A cluster can be configured with up to four different types of cores in the same cluster. Each core type targeting different power efficiency and performance levels. This arrangement allows for an intermediate core that has an intermediate performance and efficiency level. The cluster also supports complexes.</p> <p>A cluster can be configured in many arrangements. Examples of cluster arrangements are:</p> <ul style="list-style-type: none"> <li>• One or more cores of the same type.</li> <li>• Various arrangements of two types of cores. For example, one or more cores targeting either a high-performance level or a higher power efficiency level.</li> <li>• Various arrangements of three or four types of cores. For example, one or more high-performance cores, power-efficient cores, and intermediate cores.</li> <li>• One or more complexes and no individual cores. For information on complexes, see <a href="#">2.3.1 What is a complex?</a> on page 25.</li> <li>• One or more complexes and individual cores.</li> </ul> <p>Arm DynamIQ™ Shared Unit-110 Technical Reference Manual at p. 22</p>

	<div><div><div><div><div><div>Complex 0</div><div>Core 0</div><div>Core 1</div><div>Shared logic</div></div></div><div><div>Complex 1</div><div>Core 2</div><div>Core 3</div><div>Shared logic</div></div></div><div><div>Complex 2</div><div>Core 4</div><div>Core 5</div><div>Shared logic</div></div><div><div>Complex 3</div><div>Core 6</div><div>Core 7</div><div>Shared logic</div></div></div><div>DynamiQ cluster shared logic</div></div> <div><div>Supported core in complex</div></div> <div>Arm DynamiQ™ Shared Unit-110 Technical Reference Manual at p. 24</div> <div>The DSU-110 DynamiQ™ cluster supports blocks that are called complexes which contain up to two cores of the same type and some shared logic. Sharing some logic between the two cores of a dual core complex can make the dual core complex area efficient. However, this area efficiency is at the cost of reduced performance compared with using two single-core complexes.</div> <div>Arm® DynamiQ™ Shared Unit-110 Technical Reference Manual at p. 25</div>

Claim 1	Accused Products
	<p>The <i>DynamiQ™ Shared Unit-110</i> (DSU-110) has multiple clock domains. Each core or complex can be implemented in a separate clock domain.</p> <p>The following figure shows the clock domains for an example cluster with four standalone cores.</p> <p><b>Figure 4-1: DSU-110 clock domains</b></p> <p>■ PPUCLK    ■ ATCLK    ■ CORE0CLK to CORE3CLK ■ PERIPHCLK    ■ SCLK    ■ Includes CORExCLK, PERIPHCLK, ATCLK, and SCLK domains ■ GICCLK    ■ PCLK</p> <p>Arm <i>DynamiQ™ Shared Unit-110</i> Technical Reference Manual at p. 46</p> <p>The <i>DynamiQ™ Shared Unit-110</i> (DSU-110) <i>Power Policy Units</i> (PPUs) control power management for the Cortex®-A510 core. A Cortex®-A510 complex supports separate gated power domains for the complex, for each core inside the complex, and for the <i>Vector Processing Unit</i> (VPU). It also supports a dedicated voltage domain for each complex, and a voltage domain for the DSU-110 <i>DynamiQ™</i> cluster.</p> <p>Arm Cortex-A510 Core Technical Reference Manual at p. 39</p>

Claim 1	Accused Products												
	<p>The cluster contains several clock domains for functionality that is likely to be connected to different clocks in the system. Within each core, the CPU bridge contains asynchronous bridges for all crossings between the core and cluster clock domains. Each CPU bridge is split, with one half of each bridge in the core clock domain and the other half in the relevant cluster domain. At the cluster level, there is the <i>Snoop Control Unit</i> (SCU) bridge which contains crossings between the cluster clock domains as required.</p> <p>Arm DynamIQ™ Shared Unit-110 Technical Reference Manual at p. 46</p> <p>The DynamIQ Shared Unit-110 (DSU-110) has a separate clock signal for each standalone core or complex. There are also separate clocks for the internal logic, and some of the e interfaces.</p> <p>The following table describes the clock signals of the DSU-110.</p> <table><tr><th colspan="2">Table 1. DSU-110 clock signals</th></tr><tr><th>Signal</th><th>Description</th></tr><tr><td rowspan="2">COREyCLK</td><td>The clocks for each of the cores in the cluster that are not part of a complex.</td></tr><tr><td>y is the core instance number, for example, CORE0CLK is the clock for core 0.</td></tr><tr><td rowspan="2">COMPLEXxCLK</td><td>These signals clock all core logic, including L1 and L2 caches.</td></tr><tr><td>The clocks for each complex in the cluster. Claim 1	Accused Products
	<p>Our initial testing shows that Snapdragon 835's Kryo 280 CPU is an octa-core, big.LITTLE configuration with four semi-custom A73 "performance" cores and four semi-custom A53 "efficiency" cores. Kryo 280's performance cores are pretty much equivalent to Kirin 960's A73 cores in both integer and floating-point IPC, but comparing them to Snapdragon 820's Kryo CPU shows mixed results: integer IPC improves but floating-point regresses.</p> <p><a href="https://www.anandtech.com/show/11201/qualcomm-snapdragon-835-performance-preview/6">https://www.anandtech.com/show/11201/qualcomm-snapdragon-835-performance-preview/6</a></p> <p><b>Voltage domains</b></p> <p>The voltage supply to a domain might be scaled or removed for power or performance reasons.</p> <p>Except for low complexity solutions, it is rare to use a single logic voltage supply for the whole SoC.</p> <p>The primary reason for additional voltage domains is to support DVFS for functional areas of the SoC. The second reason is to enable external supply switch-off, or reduction to non-functional state retention levels, to some logic areas while maintaining an operational level supply to others.</p> <p>However, the cost for additional voltage domains is significant, because additional voltage regulators, extra effort, and complexity are required in the SoC physical implementation. Therefore, you must carefully assess the value of the addition of each voltage domain against the performance and power requirements for the design.</p> <p>In a big.LITTLE system, each cluster must have a dedicated voltage supply. This is a critical success factor when combined with big.LITTLE software.</p> <p>"High-level Considerations for Power Management of a big.LITTLE™ System Application Note 424," available at <a href="https://developer.arm.com/documentation/dai0424/a/">https://developer.arm.com/documentation/dai0424/a/</a></p>

## Claim 1

## Accused Products

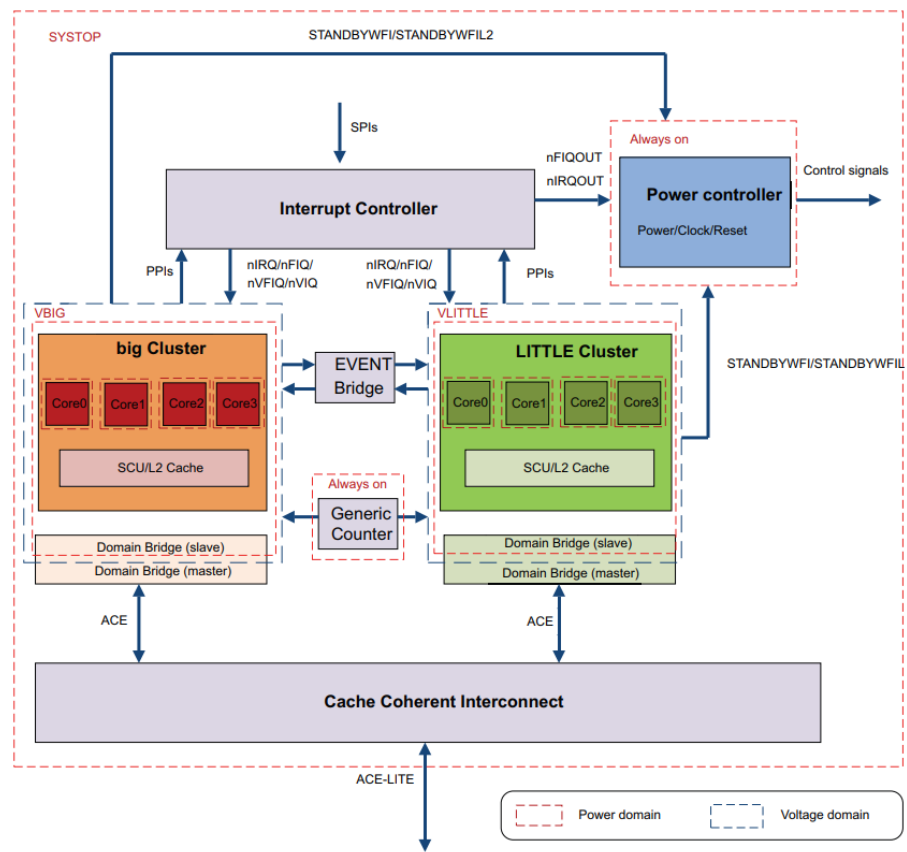

Figure 2-2 Power domain hierarchy

In Figure 2-2, two processor clusters are implemented with per-core and cluster power domains. The big cluster is in the VBIG voltage domain, while the LITTLE cluster is in the VLITTLE voltage domain. The system controller is in an always-on power domain. All the other components are in the system logic power domain (SYSTOP).

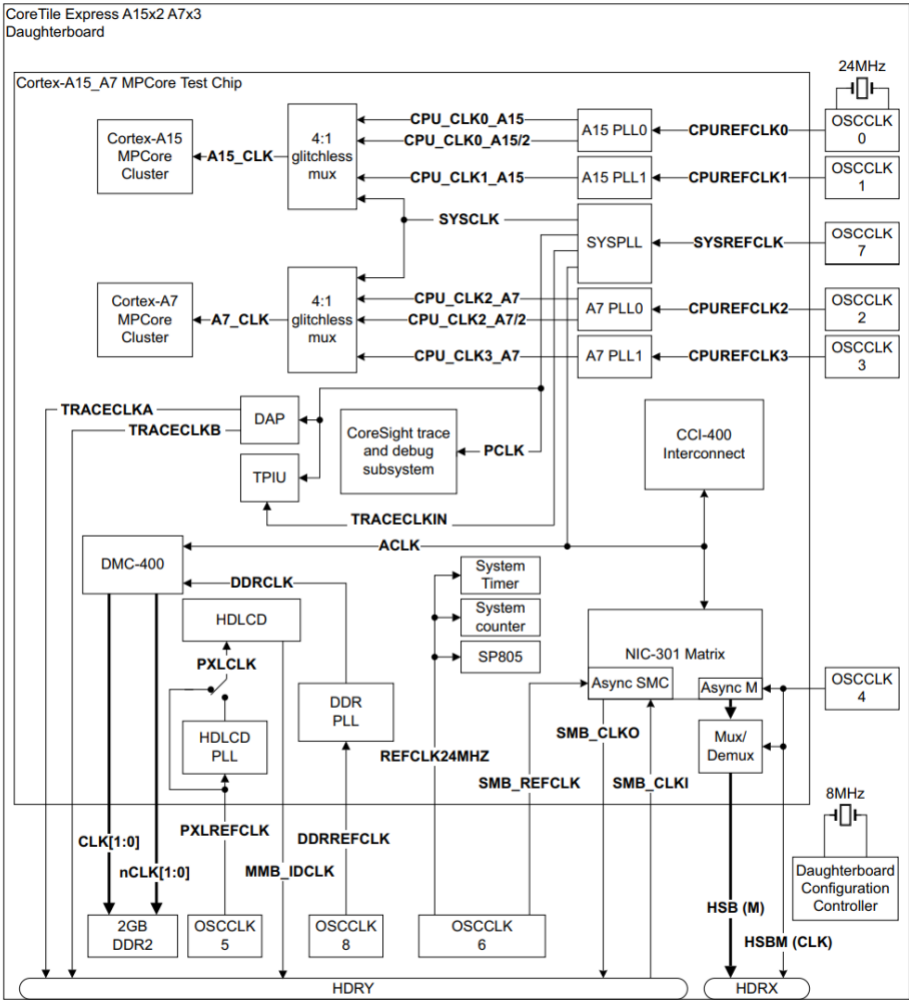

Figure 2-10 CoreTile Express A15x2 A7x3 daughterboard clocks

ARM® CoreTile Express A15x2 A7x3 Technical Reference Manual, available at <https://developer.arm.com/documentation/ddi0503/i/>

Claim 1	Accused Products
<p>[1b] a second set of processor cores of the multi-core processor, wherein each processor core from the second set of processor cores is configured to dynamically receive a second supply voltage and a second output clock signal of a second PLL having a second clock signal as input, wherein the first supply voltage is independent from the second supply voltage, and the first clock signal is independent from the second clock signal; and</p>	<p>Each Accused Product comprises a second set of processor cores of the multi-core processor, wherein each processor core from the second set of processor cores is configured to dynamically receive a second supply voltage and a second output clock signal of a second PLL having a second clock signal as input, wherein the first supply voltage is independent from the second supply voltage, and the first clock signal is independent from the second clock signal.</p> <p>For example, in addition to the first set of processor cores, the Snapdragon 8 Gen 2 Octa-Core has a second set of high-performance processor cores (two or more ARM Cortex-A710 cores). For another example, in addition to the first set of processor cores, the Snapdragon 8 Gen 2 Octa-Core has a second set of high-performance processor cores (two or more ARM Cortex-A715 cores). The processor cores in the second set receive a second, independent dynamic supply voltage and a second clock signal of a second PLL receiving an independent second clock signal.</p> <p>For a further example, in addition to the first set of processor cores, the Snapdragon 835 Mobile Platform has a second set of high-performance processor cores (two or more A73 cores). The processor cores in the second set receive a second, independent dynamic supply voltage and a second clock signal of a second PLL receiving an independent second clock signal.</p> <p>ARM documentation for the big.LITTLE and DynamIQ architectures used in the Accused Products directly shows that each core cluster receives its own clock domain. At the time the Accused Products were designed, it was typical to produce this clock using a PLL that has a corresponding clock input. Furthermore, ARM documentation for an earlier, related device (the Cortex-A15_A7 MPCore test chip, which also has independent clock domains for different CPU clusters) shows each CPU cluster receiving an output clock signal from a PLL having a corresponding clock signal as input (<i>e.g.</i> from an oscillator). It is therefore substantially likely that each Accused Product specifically receives a second output clock signal of a second PLL having a second clock signal as input.</p> <p><i>See, e.g.:</i></p>

Does not support DVFS.</p> <p><i>Id.</i> at p. 48</p> <p><b>SCP runtime firmware</b></p> <p>The SCP runtime firmware executes after <i>Trusted Firmware for A-profile</i> (TF-A) BL2 has authenticated and copied it from flash.</p> <p>The SCP runtime firmware performs the following functions:</p> <ul style="list-style-type: none"> <li>• Responds to <i>System Control and Management Interface</i> (SCMI) messages through <i>Message Handling Unit</i> (MHU) version 2.0 for processor power control and <i>Dynamic Voltage and Frequency Scaling</i> (DVFS)</li> <li>• Power domain management</li> <li>• Clock management</li> </ul> <p><i>Id.</i> at p. 65</p>

Claim 1	Accused Products
	<p>Our initial testing shows that Snapdragon 835's Kryo 280 CPU is an octa-core, big.LITTLE configuration with four semi-custom A73 "performance" cores and four semi-custom A53 "efficiency" cores. Kryo 280's performance cores are pretty much equivalent to Kirin 960's A73 cores in both integer and floating-point IPC, but comparing them to Snapdragon 820's Kryo CPU shows mixed results: integer IPC improves but floating-point regresses.</p> <p><a href="https://www.anandtech.com/show/11201/qualcomm-snapdragon-835-performance-preview/6">https://www.anandtech.com/show/11201/qualcomm-snapdragon-835-performance-preview/6</a></p> <p><b>Voltage domains</b></p> <p>The voltage supply to a domain might be scaled or removed for power or performance reasons.</p> <p>Except for low complexity solutions, it is rare to use a single logic voltage supply for the whole SoC.</p> <p>The primary reason for additional voltage domains is to support DVFS for functional areas of the SoC. The second reason is to enable external supply switch-off, or reduction to non-functional state retention levels, to some logic areas while maintaining an operational level supply to others.</p> <p>However, the cost for additional voltage domains is significant, because additional voltage regulators, extra effort, and complexity are required in the SoC physical implementation. Therefore, you must carefully assess the value of the addition of each voltage domain against the performance and power requirements for the design.</p> <p>In a big.LITTLE system, each cluster must have a dedicated voltage supply. This is a critical success factor when combined with big.LITTLE software.</p> <p>"High-level Considerations for Power Management of a big.LITTLE™ System Application Note 424," available at <a href="https://developer.arm.com/documentation/dai0424/a/">https://developer.arm.com/documentation/dai0424/a/</a></p>

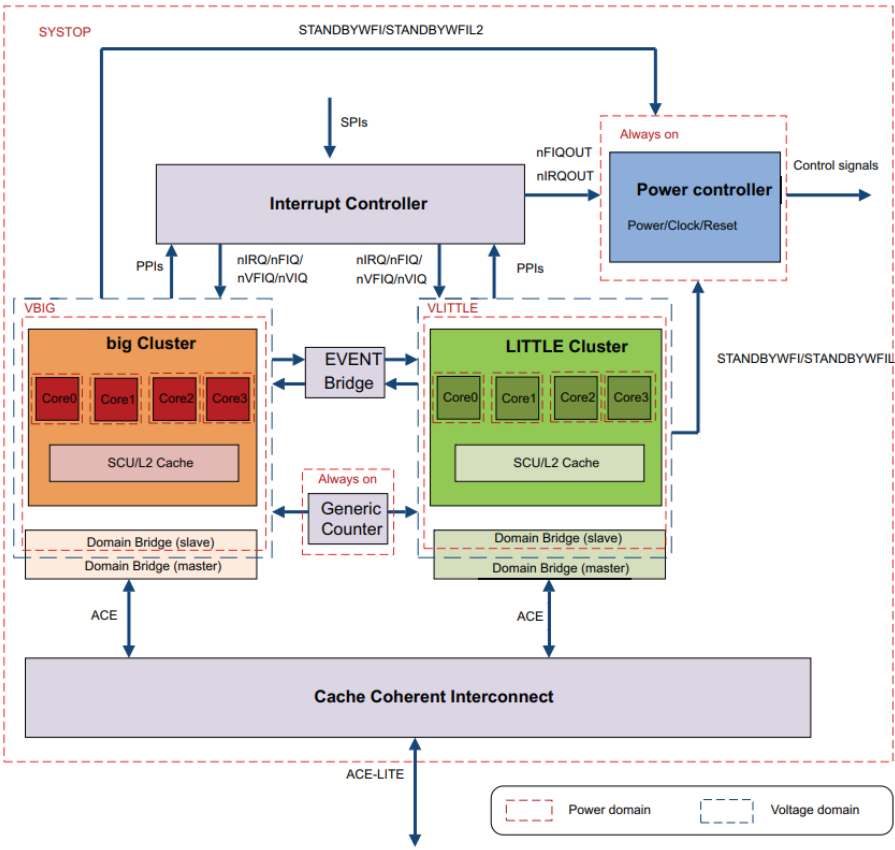

Figure 2-2 Power domain hierarchy

In Figure 2-2, two processor clusters are implemented with per-core and cluster power domains. The big cluster is in the VBIG voltage domain, while the LITTLE cluster is in the VLITTLE voltage domain. The system controller is in an always-on power domain. All the other components are in the system logic power domain (SYSTOP).

Claim 1	Accused Products
<p>[1c] an interface block coupled to the first set of processor cores and also coupled to the second set of processor cores, wherein the interface block is configured to facilitate communication between the first set of processor cores and the second set of processor cores.</p>	<p>Each Accused Product comprises an interface block coupled to the first set of processor cores and also coupled to the second set of processor cores, wherein the interface block is configured to facilitate communication between the first set of processor cores and the second set of processor cores.</p> <p>For example, the Snapdragon 8 Gen 2 Octa-Core includes a DynamIQ Shared Unit (DSU), including a Snoop Control Unit (SCU), that is coupled to each core or to each set of processor cores and is configured to communicate between the sets of processor cores, including by buffering and resynchronizing signals across clock domains and by maintaining coherency between caches in the cores or complexes and/or with the L3 shared memory implemented by the DSU.</p> <p>For another example, the Snapdragon 835 Mobile Platform includes a cache coherent interconnect, such as a CCI-400 or CCI-550, that is coupled to each core or to each set of processor cores and is configured to communicate between the sets of processor cores, for example by maintaining coherency between caches in the cores or complexes.</p> <p>As shown in the relevant documentation, described above and reiterated here for the avoidance of all possible doubt, the Accused Products implement either the big.LITTLE or DynamIQ architecture, which are the heterogeneous processing architectures for the ARM Cortex-A53/A72 and ARM Cortex-A510/A710/A715 respectively.</p> <p>The big.LITTLE architecture is also the heterogenous processing architecture for the ARM Cortex-A7 and Cortex-A15 processors. For example, ARM documentation for the big.LITTLE architecture expressly includes all four of these processors in its stated scope. ARM's public documentation of the big.LITTLE architecture describes the infringing cache coherent interconnect in general, and also in the context of a "typical big.LITTLE system" featuring Cortex-A7 and Cortex-A15 processors. There is a reasonable inference that ARM's document also applies to the Accused Products with big.LITTLE architectures including Cortex-A53 and Cortex-A72 cores.</p> <p>And the ARM documentation for the ARM Cortex-A510 processor core expressly states that it includes and supports the DynamIQ Shared Unit (DSU), creating a reasonable inference that</p>

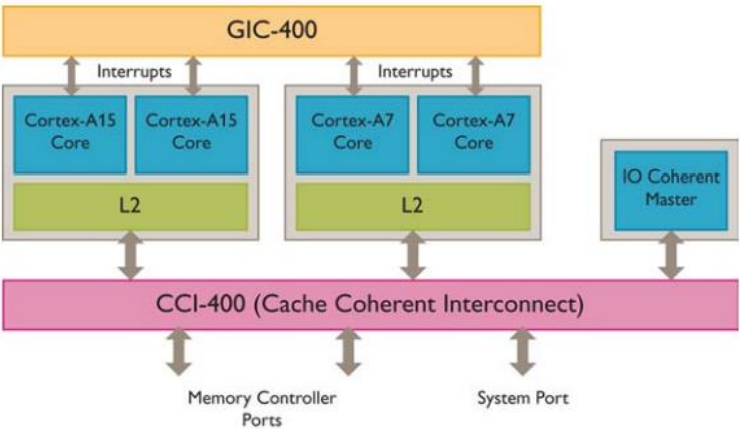

Claim 1	Accused Products
	<p>ARM's DSU documentation also applies to the Accused Products with DynamIQ architectures including Cortex-A510, Cortex-A710, and/or Cortex-A715 cores.</p> <p><i>See, e.g.:</i></p> <p>The <i>DynamIQ™ Shared Unit-110</i> (DSU-110) <i>Power Policy Units</i> (PPUs) control power management for the Cortex®-A510 core. A Cortex®-A510 complex supports separate gated power domains for the complex, for each core inside the complex, and for the <i>Vector Processing Unit</i> (VPU). It also supports a dedicated voltage domain for each complex, and a voltage domain for the DSU-110 DynamIQ™ cluster.</p> <p>Arm Cortex-A510 Core Technical Reference Manual at p. 39</p> <p>When you implement a DSU-110 DynamIQ™ cluster, all interfacing between the cores, complexes, and the <i>DynamIQ™ Shared Unit-110</i> (DSU-110) is implemented automatically. All the external signal inputs and outputs pass through the DSU-110. The DSU-110 buffers and resynchronizes many of these signals to allow cores and complexes to be clocked at different speeds.</p> <p>The memory interfacing of each core is internally connected to the DSU-110 L3 memory system. Where necessary, the DSU-110 implements additional buffering to compensate for different clock rates of the core and DSU-110 L3 memory system.</p> <p>Arm DynamIQ™ Shared Unit-110 Technical Reference Manual at p. 34</p> <p>All cores in the DSU-110 DynamIQ™ cluster, including those in complexes, are coherently connected to an L3 memory system that includes an L3 cache and a <i>Snoop Control Unit</i> (SCU). The SCU maintains coherency between caches in the cores and the L3 cache, and includes a snoop filter to optimize coherency maintenance operations. The shared L3 cache simplifies process migration between the cores.</p> <p>Arm DynamIQ™ Shared Unit-110 Technical Reference Manual at p. 18</p>

Claim 1	Accused Products
	<p><b>Snoop Control Unit</b></p> <p>The <i>Snoop Control Unit</i> (SCU) maintains coherency between all the data caches in the cluster.</p> <p>The SCU contains buffers that can handle direct cache-to-cache transfers between cores without having to read or write data to the L3 cache. Cache line migration enables dirty lines to be moved between cores. Also, there is no requirement to write back transferred cache line data to the L3 cache.</p> <p>The SCU contains a set of snoop filters that track the addresses for locations cached in the core caches. Including the snoop filters means that the SCU does not need to request a look up in the core caches when it receives a coherent memory request. These snoop filters are accessed by coherent requests from the other cores or from the system. If there is a simultaneous hit in the L3 tags and the SCU snoop filters, then the L3 cache normally provides the data in preference to a core. The size of the snoop filter is automatically determined from the configured number of cores and the cache sizes in those cores.</p> <p>Arm DynamIQ™ Shared Unit-110 Technical Reference Manual at p. 35</p>

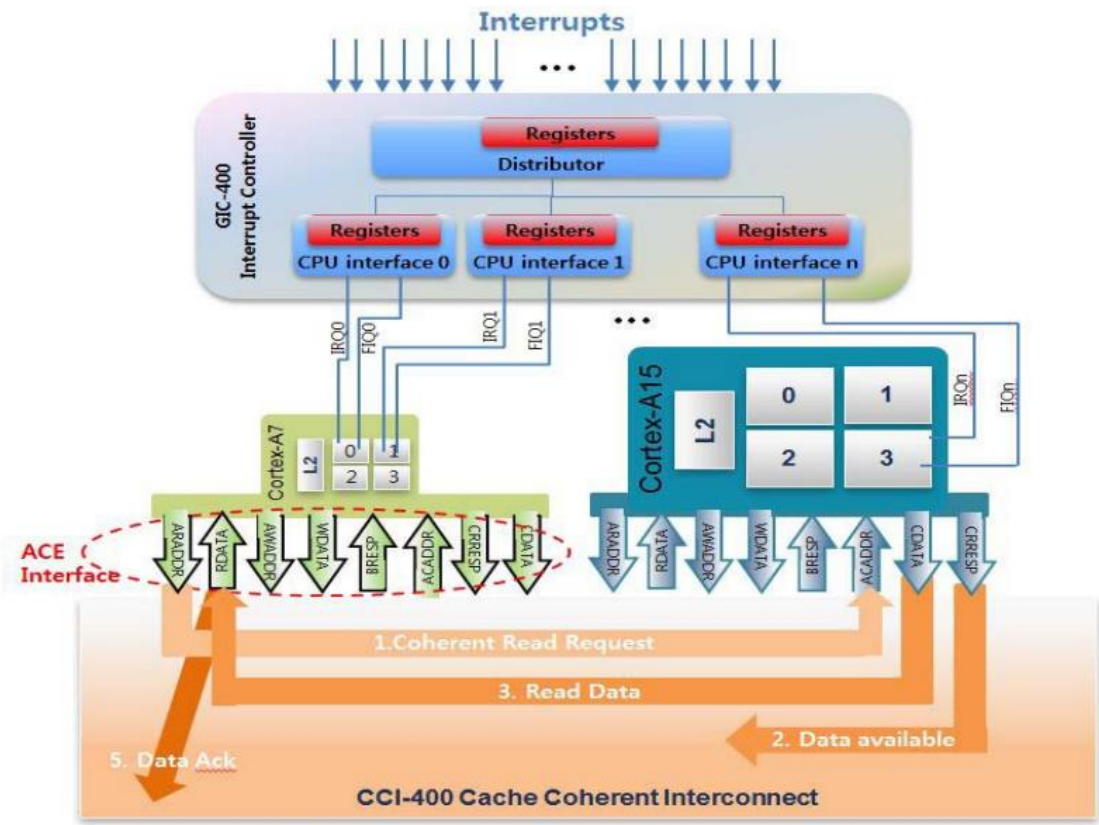

Figure 3: Cache coherency in a big.LITTLE system

ARM White Paper “big.LITTLE Technology: The Future of Mobile Making very high performance available in a mobile envelope without sacrificing energy efficiency,” available at <https://armkeil.blob.core.windows.net/developer/Files/pdf/white-paper/big-little-technology-the-future-of-mobile.pdf>

Claim 1	Accused Products
	<p>As shown in Figure 3, the bus interfaces of Cortex-A15 and Cortex-A7 processors make use of the AMBA® AXI Coherency Extensions (ACE) to the widely-used AMBA AXI protocol. This protocol provides for coherent data transfer at the bus level. In the AMBA ACE protocol, three coherency channels are added in addition to the normal five channels of AMBA AXI. As an example, the lower part of Figure shows the steps in a coherent data read from the Cortex-A7 cluster to the Cortex-A15 cluster. This starts with the Cortex-A7 cluster issuing a Coherent Read Request through the RADDR channel. The CCI-400 hands over the request to the Cortex-A15 processor's ACADDR channel to snoop into Cortex-A15 processor's cache. On receiving the request from CCI-400, the Cortex-A15 processor checks the data availability and reports this information back through the CRRESP channel. If the requested data is in the cache, the Cortex-A15 processor places it on the CDATA channel. Then the CCI-400 moves the data from the Cortex-A15 processor's CDATA channel to the Cortex-A7 processor's RDATA channel, resulting in a cache linefill in the Cortex-A7 processor. The CCI-400 and the ACE protocol enable full coherency between the Cortex-A15 and Cortex-A7 clusters, allowing data sharing to take place without external memory transactions.</p> <p>ARM White Paper “big.LITTLE Technology: The Future of Mobile Making very high performance available in a mobile envelope without sacrificing energy efficiency,” available at <a href="https://armkeil.blob.core.windows.net/developer/Files/pdf/white-paper/big-little-technology-the-future-of-mobile.pdf">https://armkeil.blob.core.windows.net/developer/Files/pdf/white-paper/big-little-technology-the-future-of-mobile.pdf</a></p>
